This report is intended for use by qualified professionals only and is not to be shared with the examinee or any other unqualified persons. Since the questionnaire relies on self-report data, all responses should be verified by a clinician.

## PAR

## Overview

Sample, a 26-year-old, completed the Language Acculturation Meter (LAM) on 12/09/2020. The LAM is an instrument designed for individuals of all ages who are transitioning from Spanish to English-language proficiency. It provides information about the individual's background and educational history and assesses their use and perceived understanding of English. Sample's scores were compared to a combined group of U.S. natives and non-U.S. natives.

Sample reported arriving in the U.S. from Argentina. They arrived in the U.S. at 18 years of age. They have lived in the U.S. for 7 years and 11 months. Sample reported "Decent. With some trouble finding the correct word" when asked to describe their level of comfort and amount of conversational English.

Sample's Total scale score is in the $66^{\text {th }}$ percentile. Scores for the Everyday Language Usage and English Comprehension scales are in the $76{ }^{\text {th }}$ and $62^{\text {nd }}$ percentiles, respectively. When examining by cluster, Sample scored in the $58^{\text {th }}$ percentile for Home Environment, the $81^{\text {st }}$ percentile for Social Interaction, and the $73^{\text {rd }}$ percentile for Academic/Cognitive. Based on their responses to the Academic/Cognitive items, Sample may have achieved cognitive academic language proficiency. Additional follow-up is required to determine if assessment in English is appropriate.
