

OASR/60-90+ - Narrative Report & Critical Items

ID: WT-45-A

Birth Date: 11/01/1919

Date Filled: 01/11/2005

Name: Harold Broach

Gender: Male

Informant: Self

Age: 85

Clinician: Your Clinician 1

The Older Adult Self-Report (OASR) was completed by Harold to obtain his perceptions of his adaptive functioning, substance use, and problems.

On the adaptive functioning scales, Harold's scores on the Friends and Personal Strengths scales were in the borderline clinical range (3rd to 7th percentiles). No score was calculated for the Spouse/Partner scale because Harold had not lived with a partner in the previous 2 months. Harold indicated that he has never been married.

Harold reported that he did not use drugs for nonmedical purposes during the past 2 months. He used tobacco 14 times a day in that time. Harold reported that he consumed more than 5 alcoholic drinks a day on 6 days in the past 2 months. He was also drunk on one day during that period.

On the OASR problem scales, Harold's Total Problems score was in the normal range for men over age 75. His scores on the Anxious/Depressed, Worries, Somatic Complaints, Functional Impairment, and Memory/Cognition Problems syndromes were in the normal range. His score on the Thought Problems syndrome was in the clinical range (above the 97th percentile). His score on the Irritable/Disinhibited syndrome was in the borderline clinical range (93rd to 97th percentiles). These results indicate that Harold reported more problems than are typically reported by men over age 75, particularly thought problems and irritable or disinhibited behavior. Harold's scores on Critical Items are listed in the box below. The sum of his scores on the Critical Items was in the normal range.

On the DSM-oriented scales, Harold's scores on the Depressive Problems, Anxiety Problems, Somatic Problems, and Dementia Problems scales were in the normal range. His score on the Antisocial Personality Problems scale was in the clinical range (above the 97th percentile). His score on the Psychotic Problems scale was in the borderline clinical range (93rd to 97th percentiles). These results suggest that the DSM should be consulted to determine whether Harold meets diagnostic criteria for Antisocial Personality Disorder. Harold's score in the borderline clinical range suggests that the DSM should be consulted to determine whether Harold might meet diagnostic criteria for disorders characterized by problems included on that scale.

Critical Items

In addition to the scale scores, it is important to consider scores on individual problem items. Because they may raise particular challenges for management, it is especially important to note the problems listed below that were reported with scores of 1 or 2. Look at comments made by the informant on the form in relation to these problems to obtain more information about risks associated with the problems and the contexts in which the problems occur.
