

YSR/11-18 - Narrative Report & Critical Items

Scored using T scores for United States

ID: 200105-003
Name: Catherine A. Holcomb
Age: 11

Birth Date: 06/16/1989
Gender: Female
Date Filled: 12/04/2000

Informant: Self
Clinician: Theresa Lopez

The Youth Self-Report (YSR) was completed by Catherine to obtain her perceptions of her competencies and problems. Catherine reported that she participates in two sports and that she has interests in three hobbies. She belongs to two social organizations, teams or clubs. Catherine reported that she has no jobs or chores. Catherine's responses indicate that she has no close friends and that she sees friends less than once a week outside of regular school hours. Catherine rated her school performance as below average in language arts, below average in social studies, below average in math, and failing in science.

Catherine's Total Competence score was in the clinical range below the 10th percentile for self-reports by girls aged 11 to 18. Her scores on the Activities and Social scales were both in the borderline clinical range (3rd to 7th percentiles). Catherine's score on the Positive Qualities scale was in the borderline clinical range (3rd to 7th percentiles).

On the YSR problem scales, Catherine's Total Problems and Internalizing scores were both in the clinical range above the 90th percentile for girls aged 11 to 18. Her Externalizing score was in the borderline clinical range (84th to 90th percentiles). Her scores on the Withdrawn/Depressed, Social Problems, Thought Problems, Attention Problems, and Rule-Breaking Behavior syndromes were in the normal range. Her scores on the Anxious/Depressed, Somatic Complaints, and Aggressive Behavior syndromes were in the borderline clinical range (93rd to 97th percentiles). These results indicate that Catherine reported more problems than are typically reported by girls aged 11 to 18, particularly problems of anxiety or depression, somatic complaints, and problems of an aggressive nature.

On the DSM-oriented scales, Catherine's scores on the Affective Problems, Anxiety Problems, Attention Deficit/Hyperactivity Problems, and Conduct Problems scales were in the normal range. Her scores on the Somatic Problems and Oppositional Defiant Problems scales were in the borderline clinical range (93rd to 97th percentiles). Catherine's scores in the borderline clinical range suggest that the DSM should be consulted to determine whether Catherine might meet diagnostic criteria for disorders characterized by problems included on those scales.

On the 2007 scales, Catherine's score on the Obsessive-Compulsive Problems scale was in the normal range. Her score on the Post-traumatic Stress Problems scale was in the borderline clinical range (93rd to 97th percentiles). Catherine's score in the borderline clinical range suggests that the DSM should be consulted to determine whether Catherine might meet diagnostic criteria for disorders characterized by problems included on that scale.

Critical Items

In addition to the scale scores, it is important to consider scores on individual problem items. Because they may raise particular challenges for management, it is especially important to note the problems listed below that were reported with scores of 1 or 2. Look at comments made by the informant on the form in relation to these problems to obtain more information about risks associated with the problems and the contexts in which the problems occur.

<u>Score</u>	<u>Problem Item</u>	<u>Score</u>	<u>Problem Item</u>
0	18. HarmSelf	0	70. SeesThings
0	40. HearsThings	0	72. SetsFires
0	57. Attacks	0	91. ThinkSuic
0	67. RunAway	0	105. UsesDrugs
