

# The difference is clear

Using high-quality digital photographs instead of outdated and potentially confusing line drawings and sketches, the VAS-E and VAS-R provide a superior measure of vocabulary and language development.

## With the VAS-E and VAS-R, you can:

- **Evaluate with greater iconicity and ecological validity:** Full-color photographs provide the highest degree of realism.
- **Obtain an enhanced skill assessment:** Composite and discrepancy scores give you more data with which to interpret an individual's expressive and receptive performance.
- **Monitor effectiveness of interventions:** Reliable change scores enable you to measure growth over time and in response to targeted interventions.

## Results you can trust

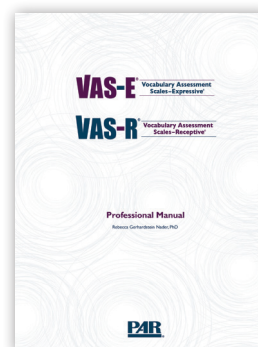

- Normative data are based on a sample of 2,678 individuals representative of the 2009 U.S. Census.
- Age-based normative data are provided for 28 different groups, and grade-based norms are provided for children and adolescents enrolled in prekindergarten to Grade 12.
- Equivalent, conormed forms (Forms A and B) reduce the occurrence of practice effects.
- Few overlapping words occur between the VAS-E and VAS-R, a significant improvement over existing vocabulary tests.
- Validity groups include children and adults with speech impairment, language delay, language disorder, dementia, hearing impairment, reading disability, intellectual developmental disorder, emotional disturbance (ED), ADHD, ASD, TBI, and gifted and talented individuals.

**VAS:** high-quality digital photographs

**Others:** outdated and potentially confusing line drawings

### At a Glance

- Purpose:** Measure vocabulary and oral language development
- Age:** 2 years, 6 months to 95 years
- Format:** Paper and pencil; reports available digitally via PARiConnect
- Time:** 15-20 minutes each
- Qualification Level:** B or S
